

Classes And Objects In Java

Generated Aug 19, 2026 8:48 AM

What We'll Learn

By the end of this lesson, students can:

- Define a class in Java.
- Declare attributes and methods inside a class.
- Create objects using the new keyword.
- Assign values to an object's attributes.
- Access attributes and call methods using the dot operator.
- Create multiple objects from the same class.

Before We Start

In the previous lesson, we learned that a class is a blueprint and an object is a specific instance created from that blueprint.

Consider a Student class.

What information should every student object store? What actions should a student object be able to perform?

Let's Understand

Defining A Class

A class groups related attributes and methods in one structure.

The basic syntax for creating a class is:

```
``java class ClassName { // Attributes
```

```
// Methods
```

```
}
```
