

Introduction To HTML Forms And The Form Element

Generated Aug 12, 2026 10:31 PM

What We'll Learn

By the end of this lesson, students can explain the purpose of HTML forms and create a basic form using the `<form>` element.

Before We Start

Have you ever completed a registration form, login form, survey, or search form online?

What information did the form ask you to enter?

Let's Understand

An HTML form is used to collect information from users.

Forms are commonly used for:

- Registration
- Login
- Surveys
- Contact information
- Online orders
- Search boxes

The `<form>` element creates a container for the form fields.

```
<form>
  Form fields will be placed here.
</form>
```

The opening `<form>` tag marks the beginning of the form.

The closing `</form>` tag marks the end of the form.

Form elements such as labels, input fields, checkboxes, and buttons are placed between these tags.

```
<form>
  <label for="student-name">Student Name:</label>
  <input type="text" id="student-name" name="studentName">
</form>
```

This course uses pure HTML. The forms can display fields and collect information on the webpage, but the information will not be stored because there is no backend or database.

Let's Practice

Create a basic HTML page containing a form.

Inside the form, add a paragraph containing the text:

Student information will be entered here.

Your form should follow this structure:

```
<form>
  <p>Student information will be entered here.</p>
</form>
```
