

Creating HTML Documents Using an Editor

Generated Jul 7, 2026 10:11 PM

What We'll Learn

By the end of this lesson, students can use an HTML editor to create, save, and open a basic HTML document in a web browser.

Words We'll Use

- HTML Editor
- File
- Browser
- Save
- Preview

Before We Start

What apps or tools have you used to type or edit text on a computer?

Let's Understand

An HTML editor is a tool used to write and edit HTML code. Examples include Notepad, Visual Studio Code, Sublime Text, or any simple text editor.

To create an HTML document, we write the HTML code, save the file using the `.html` extension, and open it in a web browser.

Example file name:

```
my-first-page.html
```

The browser reads the HTML file and displays the webpage.

A basic HTML document looks like this:

```
<!DOCTYPE html>
<html>
<head>
  <title>My First HTML Page</title>
</head>
<body>
  <h1>Hello, World!</h1>
```

```
<p>This is my first HTML document.</p>
</body>
</html>
```

Let's Practice

Open your HTML editor and create a new file.

Type the following HTML code:

```
<!DOCTYPE html>
<html>
<head>
  <title>My First HTML Page</title>
</head>
<body>
  <h1>Hello, World!</h1>
  <p>This is my first HTML document.</p>
</body>
</html>
```

Save the file as:

```
my-first-page.html
```

Open the file in a web browser and check if the heading and paragraph appear correctly.

Now We Apply

Create your own HTML document using an editor.

Your webpage should include:

- A page title
- One main heading
- One paragraph about yourself, your hobby, or your favorite subject

Save your file using the .html extension, then open it in a browser.

Challenge Task

Edit your webpage by adding:

- Another heading
- Another paragraph
- A short sentence explaining why you want to learn HTML

Save the file again and refresh the browser to see the changes.

How Our Work Will Be Checked

- File is saved with the .html extension
- HTML document opens correctly in a browser
- Page includes a title, heading, and paragraph
- Code uses the correct basic HTML structure
- Student can explain how to edit, save, and refresh the webpage

Let's Reflect

Why is it important to save the file correctly before opening it in a browser?
