Challenge Task

Activity: Student Purchase Receipt Generator

Lessons Covered

- Lesson 21: Getting User Input Using Scanner in Java
- Lesson 22: Formatting Clear Java Program Output

Objective

Create a Java program that receives purchase information from the user, performs calculations, and displays a clear and properly formatted receipt.

Problem

A school supply store needs a simple Java program for recording a student's purchase.

The program must ask the user to enter:

- Student name
- Product name
- Product price
- Quantity purchased
- Amount paid

The program must calculate:

- Total cost
- Change

Program Requirements

Create a Java program named:

StudentPurchaseReceipt

The program must:

1. Import and use the Scanner class.
2. Ask the user to enter all required information.
3. Store each entered value in an appropriate variable.

4. Calculate the total cost.
5. Calculate the change.
6. Display all monetary values using two decimal places.
7. Display the receipt using clear labels, spacing, and separators.
8. Close the Scanner after receiving all input.

Expected Program Interaction

```
Enter student name: Maria Santos
Enter product name: Notebook
Enter product price: 35.50
Enter quantity: 3
Enter amount paid: 150.00
```

Expected Output

```
=====
                SCHOOL SUPPLY RECEIPT
=====
Student Name   : Maria Santos
Product Name   : Notebook
Product Price  : PHP 35.50
Quantity      : 3
-----
Total Cost     : PHP 106.50
Amount Paid    : PHP 150.00
Change        : PHP 43.50
=====
                Thank you for your purchase!
=====
```

The information shown in the receipt must come from the values entered by the user.

Do not place fixed student names, product names, prices, quantities, or payment values directly in the program output.

For this activity, assume that the amount paid is always enough to cover the total cost.
