

# Creating Table Rows and Data Cells

Generated Aug 4, 2026 3:40 PM

---

## What We'll Learn

By the end of this lesson, students can create table rows and add data cells using the `<tr>` and `<td>` elements.

## Before We Start

Think of a class schedule or a list of student information.

How can the information be arranged using rows and columns?

# Let's Understand

---

An HTML table uses rows and data cells to organize information.

The `<tr>` element creates a table row.

The `<td>` element creates a table data cell inside a row.

```
<table>
  <tr>
    <td>Angela</td>
    <td>Grade 9</td>
  </tr>
</table>
```

In this example:

- `<table>` creates the entire table.
- `<tr>` creates one table row.
- Each `<td>` creates one data cell.
- The row contains two data cells.

To add another row, create another pair of `<tr>` tags.

```
<table>
  <tr>
    <td>Angela</td>
    <td>Grade 9</td>
  </tr>
  <tr>
    <td>Joshua</td>
    <td>Grade 10</td>
  </tr>
</table>
```

This table contains two rows and two columns.

Each row should contain the same number of data cells so that the information remains properly organized.

## Let's Practice

---

Study the following HTML table:

```
<table>
  <tr>
    <td>Monday</td>
    <td>Mathematics</td>
    <td>8:00 AM</td>
  </tr>
  <tr>
    <td>Tuesday</td>
    <td>Science</td>
    <td>9:00 AM</td>
  </tr>
</table>
```

Answer the following questions:

1. How many table rows are present?
2. How many data cells are in each row?
3. How many columns does the table have?
4. Which element creates a table row?
5. Which element contains the table data?

## Challenge Task

---

Create an HTML table that displays three school supplies and their quantities.

Your table must contain:

- Three table rows
- Two data cells in each row
- The name of each school supply
- The quantity of each school supply
