

Understanding HTML Table Elements

Generated Aug 4, 2026 3:02 PM

What We'll Learn

By the end of this lesson, students can identify and explain the basic HTML elements used to create a table.

Before We Start

Where have you seen information arranged in rows and columns?

Let's Understand

An HTML table organizes information into rows and columns.

The basic HTML table elements are:

- `<table>` – creates the entire table
- `<tr>` – creates a table row
- `<th>` – creates a table heading cell
- `<td>` – creates a table data cell

Here is the basic structure of an HTML table:

```
<table>
  <tr>
    <th>Name</th>
    <th>Grade Level</th>
  </tr>
  <tr>
    <td>Angela</td>
    <td>Grade 9</td>
  </tr>
</table>
```

The first row contains the table headings. The second row contains the table data.

Each `<th>` and `<td>` element must be placed inside a `<tr>` element.

Let's Practice

Identify the purpose of each HTML table element:

1. `<table>`
2. `<tr>`
3. `<th>`
4. `<td>`

Then identify how many rows and columns are in the example table.

Challenge Task

Create a simple HTML table that shows the names and favorite subjects of three students.
