

Building HTML Tables

Generated Jul 29, 2026 11:34 PM

What We'll Learn

By the end of this lesson, students can create an HTML table using rows, headings, and data cells.

Words We'll Use

- Table
- Row
- Column
- Table heading
- Table data

Before We Start

Where have you seen tables used to organize information?

Let's Understand

An HTML table organizes related information into rows and columns.

The `<table>` element creates the table.

The `<tr>` element creates a table row.

The `<th>` element creates a heading cell.

The `<td>` element creates a data cell.

Basic structure:

```
<table>
  <tr>
    <th>Name</th>
    <th>Grade Level</th>
  </tr>
  <tr>
    <td>Ana</td>
    <td>Grade 9</td>
  </tr>
</table>
```

Each `<tr>` contains the cells that belong to one row.

Let's Practice

Create a table that displays the names and favorite subjects of three students.

Now We Apply

Create a class schedule using an HTML table.

Include the following columns:

- Time
- Subject
- Teacher

Add at least four subjects to the table.

How Our Work Will Be Checked

- Correct use of <table>
- Correct use of table rows
- Correct use of heading and data cells
- Complete and properly organized information
- Proper opening and closing tags

Let's Reflect

How do HTML tables make information easier to understand?

Resources / References
