

Creating Ordered and Unordered Lists

Generated Jul 15, 2026 10:05 PM

What We'll Learn

By the end of this lesson, students can:

- identify ordered and unordered lists;
- create lists using HTML;
- add list items using the `<li>` element; and
- choose the correct type of list for different information.

Words We'll Use

- List
- Ordered List
- Unordered List
- List Item
- Numbered List
- Bulleted List

Before We Start

Think about the following information:

- Steps for preparing food
- Items in a shopping list
- Names of your favorite subjects

Which information should be arranged using numbers? Which information can use bullet points?

Let's Understand

HTML lists are used to organize related information.

There are two common types of HTML lists:

1. Ordered lists
2. Unordered lists

Ordered List

An ordered list displays items using numbers.

Use the `<ol>` element to create an ordered list.

Each item inside the list must use the `<li>` element.

```
<ol>
  <li>First item</li>
  <li>Second item</li>
  <li>Third item</li>
</ol>
```

The browser displays the items in numbered order.

Unordered List

An unordered list displays items using bullet points.

Use the `<ul>` element to create an unordered list.

Each item inside the list must also use the `<li>` element.

```
<ul>
  <li>First item</li>
  <li>Second item</li>
  <li>Third item</li>
</ul>
```

The browser displays a bullet before each item.

Let's Practice

Create an HTML webpage with the title **My Favorite Foods**.

The webpage must include:

- one main heading;
- one short paragraph;
- an unordered list containing at least five favorite foods; and
- complete HTML document structure.

Now We Apply

Create a webpage titled **How I Prepare for School**.

Your webpage must contain:

- a main heading;
- an unordered list of at least five things you need for school;
- an ordered list of at least five steps you follow when preparing for school; and
- complete HTML document structure.

Use the correct HTML elements:

```
<ul>
  <li>Item</li>
</ul>
```

```
<ol>
  <li>Step</li>
</ol>
```

How Our Work Will Be Checked

- Complete HTML document structure
- Correct use of `<ol>`
- Correct use of `<ul>`
- Correct use of `<li>`
- Appropriate use of ordered and unordered lists
- Complete and understandable list items
- Proper opening and closing tags

Let's Reflect

Answer the following questions:

1. What is the difference between an ordered list and an unordered list?
2. When should you use an ordered list?
3. When should you use an unordered list?
4. What HTML element is used for each item inside a list?
